Insights & Suggested Actions

Purpose: Identify attendance patterns and opportunities to reduce missed appointments. These findings show associations, not causes. Suggested actions require testing before wider use.

1. Support Patients with Repeated Missed Appointments
Insight: A high personal no-show rate can reflect limited appointment history. One missed appointment out of one booking produces a 100% rate. Patients with five or more missed appointments form a separate group worth reviewing, but their total appointment count also matters.
Suggested action: Review missed counts, rates, and appointment history together. Offer supportive follow-up to understand possible barriers, such as transport or difficulty cancelling. Use these findings to guide support rather than automatic booking restrictions.

2. Use Neighborhood Volume to Plan Follow-Up Resources
Insight: The neighborhood analysis highlights areas such as Jardim Camburi and Itararé with large numbers of missed appointments. High counts may partly reflect higher appointment demand.
Suggested action: Compare total bookings, missed appointments, and no-show rates together when allocating follow-up resources. Use patient detail views to investigate attendance history. Neighborhood alone should not determine an individual patient's risk.

3. Investigate Differences by Booking Time
Insight: Appointments booked in the afternoon and evening show no-show rates of approximately 22%, compared with 19% for morning bookings. These groups describe when bookings were created, not when visits were due.
Suggested action: Check appointment counts, the timestamp's time zone, and the time between booking and the visit. Investigate whether these factors explain the difference before changing reminder practices.

4. Test Improvements to SMS Reminders
Insight: The SMS group shows an observed no-show rate of approximately 28%, compared with 17% for the group without SMS. This does not establish that SMS reminders are ineffective. The groups may differ in appointment history, booking lead time, or other characteristics.
Suggested action: Investigate how recipients were selected and, if available, reminder timing and delivery status. Pilot alternative reminder approaches, such as an earlier message with an easy cancellation or rescheduling option. Compare attendance and cancellations between similar groups. A missing reply should not automatically trigger cancellation.

5**. Review Weekday Patterns with Sample Size in Mind**
Insight: Monday and Friday show no-show rates of approximately 21%. Saturday has only nine appointments, so its rate is too uncertain to support a scheduling decision on its own.
Suggested action: Check whether weekday differences persist across weeks and booking lead times. If supported by further analysis, pilot different reminder timings and measure the results before expanding the approach.

Measure definitions: Appointment no-show rate = missed appointments ÷ total appointments. No-show patients = unique patients with at least one missed appointment during the study period. No Shows = Total Number of Missed Appointments.

Limitations: This is a historical public dataset. It does not establish the causes of missed appointments or prove that the proposed actions will improve attendance.
